AB - J04185430 Paper is composed of a paper, and a laminate resin coat layer, consisting of a low density polyethylene layer and a polypropylene resin layer, formed on one or the opposite sides of the paper so that the PP resin layer becomes the outer layer. A layer is formed on the surface of the PP resin layer by treating a release agent.

- In an example, paper with a wt. of 64 g/sq.m, a linear low density PE (10 microns thick), and a polypropylene copolymer (10 microns thick) were co-extrusion laminated so that the linear low density PE got into contact with the paper. A heat curable silicon resin was coated in an amt. of 0.7 g/sq.m on the surface of the resultant laminate, followed by heating and cur
